

Continuous Deployments with CI\CD Pipelines & Kubernetes

DEVOPSCON Berlin ONLINE

14.06.2021

Oz Tiram

Workshop

/'wə:kʃɒp/

noun: workshop; plural noun:
workshops

> a meeting at which a group of
people engage in intensive
discussion and activity on a
particular subject or project.

Who am I?

Who are you?

- What is your role?
- Have you worked with k8s before?
- How are you using kubernetes?

Agenda

- Continuous integration and continuous deployment
- Deploying straight to production
- Building a pipeline using gitlab
- Deploying to Kubernetes

What is CI\CD?

- What is Continuous Integration
- What is Continuous Delivery
- Are you doing it? How are you doing it?
- What do you like about it?
- What do you not like about it?

Continuous Integration

Continuous integration (CI) is the practice, in software engineering, of merging all developer working copies with a shared mainline several times a day.

Continuous integration involves integrating early and often, so as to avoid the pitfalls of "integration hell". The practice aims to reduce rework and thus reduce cost and time.

Continuous Delivery

Continuous Delivery doesn't mean every change is deployed to production ASAP. It means every change is proven to be deployable at any time.

Where do you deploy to?

- Do you have Jenkins or Similar at work?
- Do you have multiple “environments” at work?
- If so, how do they defer?
- What possible problem could arise from such differences?

Manual Deployment and Testing

Manual Deployment and Testing

Manual Testing is immoral. It's not just dumb - and it is dumb - it is immoral, because you are taking people and you are asking them to act like machines.

Bob Martin, The land that scrum forgot.

Continuous ~~Delivery~~ Deployment!

CONTINUOUS DELIVERY

CONTINUOUS DEPLOYMENT

Continuous Deployment

- Reduces hardware and maintenance costs
- Reduces manual labor

Continuous Deployment

- Code Changes bare risk
- Delay → more change ->→ more risk

Continuous Deployment is reducing risk!

Risk of 1 is 1/6

Risk of 6 is 1/6

Risk of 1 and 6 is 1/36

Risk of 1 and 6 or 1 and 3 is 2/36 ...

If we have a chance of 1 out 1000 that a commit is broken,

*Deploying 20 commits bears the risk of >20/1000 or >2%**

Continuous Deployment

- Code Changes bare risk
- Delay → more change ->→ more risk

Continuous Deployment is reducing risk!

Continuous Deployment Strategies

0. Application Recreation

- Strictly speaking this isn't continuous deployment.
- We replace version 1 with version 2 with a "big bang".
- Usually practiced with "Continuous Delivery"

0. Application Recreation

- The most common strategy
- Companies that have this may have one or more of:
 - Separate environments
 - Separate deployment pipeline
 - Release ceremonies and or release manager

0. Application Recreation

0. Application Recreation

Downtime!

0. Application Recreation

**Downtime with
release gone
wrong!**

0. Application Recreation

Release from QSU to
Production

Downtime with
release gone
wrong!

Downtime, how long ?!

<i>Uptime SLA</i>	<i>Monthly downtime</i>
<i>99.99</i>	<i>4 m 22s</i>
<i>99</i>	<i>7h 18m 17s</i>
<i>96</i>	<i>1d 5h 13m 9s</i>

1. Rolling release

- Easy if you automate all your tests.
- Can be rolled back automatically, if you have monitoring in place!
- Usually, it is the norm *outside* the software industry!

1. Rolling release

Risk control and management

2. Canary releases

The Scientific method!

2. Canary releases

The Scientific method!

2. Canary releases

The Scientific method!

3. A\B, Blue\Green deployment

The Scientific method with user specific targeting

Canary release, A/B Testing

- Can't be avoided in large organizations
- Allow organizations to carefully test in production

STAND BACK

**I'M GOING TO TRY
SCIENCE**

Strategy Comparison

<i>Strategy</i>	<i>Downtime</i>	<i>Real traffic testing</i>	<i>Targeting users</i>	<i>Rollback duration</i>	<i>Impact on users</i>	<i>Complexity</i>
<i>Recreate</i>	<u><i>Yes</i></u>	<i>No</i>	<i>No</i>	<i>Long</i>	<i>High</i>	<i>Low</i>
<i>Rolling</i>	<i>No</i>	<i>No</i>	<i>No</i>	<i>Long</i>	<i>Medium</i>	<i>Medium</i>
<i>Canary</i>	<i>No</i>	<u><i>Yes</i></u>	<u><i>Yes</i></u>	<u><i>Short</i></u>	<u><i>Low</i></u>	<i>High</i>
